Lab 3

## Part A

The screenshot shows a Mac desktop environment. In the center, there is a TextEdit window titled "Parser.py" containing Python code. To the left of the TextEdit window is the original XML file "20110415.VAST11MC2\_SecurityLog-rev2.xml". To the right of the TextEdit window is the output file "out.txt". The desktop background features a blue sky with clouds. The Dock at the bottom contains various application icons.

```
1 #Gabe Naples gjn5070
2 from xml.etree import ElementTree as ET
3
4 #file = ET.parse('/Users/gabe/Desktop/20110415_VAST11MC2_SecurityLog-rev2.xml')
5 File_OUT = open("out.txt",'w')
6 with open('/Users/gabe/Desktop/20110415_VAST11MC2_SecurityLog-rev2.xml', 'rt') as f:
7     tree = ET.parse(f)
8     root = tree.getroot()
9
10    test = ET.tostring(root)
11    File_OUT.write(test)
12
13
14
15    #for node in tree.iter():
16        #print node.tag, node.attrib
17
```

```

This is the code that uses the “ElementTree” library to print out the information taken from the xml document. The original document is opened on the left and the out.txt (the new file the output put information in) is on the right. Within the output file there is the addition of ‘ns0’ before the events which is associated with a namespace from the xml document. I have also done a similar copy function without using the ElementTree library which copies the file line by line and puts it in “out.txt.” The code for that is below.

The screenshot shows a Mac desktop environment. At the top is a menu bar with Apple,TextEdit, File, Edit, Format, View, Window, Help, and system status icons. Below the menu bar is a dock with various application icons. A terminal window titled "2010415\_VAST11MC2\_SecurityLog-rev2.xml" is open, displaying XML event logs. To its right is a Python script editor titled "Read-Write.py" containing code for reading and writing XML files. A file browser window titled "out.txt" shows the output of the script. The desktop background features a blue sky and clouds.

```

## Part B

The below code shows the program parsing through the tree of the XML file. When first it gets within the over “Events” and then into each “Event.” From within each “Event” it scans for the “EventID.” Then it compares the “EventID.text (which shows the text between the EventID tags)” to see if it equals “4624.” If it does, then it outputs the entire event into the file. The output is showed to the right.

The screenshot shows a Mac desktop environment. In the foreground, a terminal window displays XML event log data from '20110415\_VAST11MC2\_SecurityLog-rev2.xml'. The XML code includes various event details such as EventID, Task, Opcode, and Data. Above the terminal is a Python script named 'Parser.py' which uses the 'xml.etree.ElementTree' module to parse XML files. The script specifically looks for EventID '4624' and writes the output to 'out.txt'. To the right of the terminal, a file browser window titled 'Parser.py' shows files like 'Lab3', 'Read-Write.py', and 'Parser.py'. The desktop background is dark, and the Dock at the bottom contains icons for various Mac applications.

```

Parser.py
from xml.etree import ElementTree as ET
#file = ET.parse('/Users/gabe/Desktop/20110415_VAST11MC2_SecurityLog-rev2.xml')
File_OUT = open("out.txt","w+")
with open('/Users/gabe/Desktop/20110415_VAST11MC2_SecurityLog-rev2.xml', 'rt') as f:
    tree = ET.parse(f)
    root = tree.getroot()
for Event in root:
    if Event.tag == '{http://schemas.microsoft.com/win/2004/08/events/event}Event':
        for System in Event:
            if System.tag == '{http://schemas.microsoft.com/win/2004/08/events/event}System':
                for EventID in System:
                    if EventID.tag == '{http://schemas.microsoft.com/win/2004/08/events/event}EventID':
                        if EventID.text == "4624":
                            x = ET.tostring(Event, 'utf-8')
                            File_OUT.write(x)

```

```

## Part C

In the below code it scans to see if the text within “EventID” in the tag equals “4625.” If it does then it iterates the counter to add one and then run again, which creates a running count of all of the occurrences of that EventID.

```
Parser.py
UNREGISTERED
1
2
3
4 #file = ET.parse('/Users/gabe/Desktop/20110415_VAST11MC2_SecurityLog-rev2.xml')
5 File_OUT = open("out.txt", "w+")
6 with open('/Users/gabe/Desktop/20110415_VAST11MC2_SecurityLog-rev2.xml', 'rt') as f:
7     tree = ET.parse(f)
8     root = tree.getroot()
9     n = 0
10    for Event in root:
11        if Event.tag == '{http://schemas.microsoft.com/win/2004/08/events/event}Event':
12            for System in Event:
13                if System.tag == '{http://schemas.microsoft.com/win/2004/08/events/event}System':
14                    for EventID in System:
15                        if EventID.tag == '{http://schemas.microsoft.com/win/2004/08/events/event}EventID':

22
23                                z = str(n)
24                                File_OUT.write(z)
25
26
2
out.txt
```

Tab Size: 4      Python

## Part D

In the below screenshot it shows the code that takes the system times for event 4624 and displays them in the out.txt file in a way that shows the names of the occurrences and how many times each one occurs under the EventID of "4624." This program takes the full SystemTime which includes a longer string than just the date. The program takes the whole SystemTime and then converts it to a string and shortens it to include only the first 12-character spaces which is the date. It then takes that value and adds it to a dictionary. When adding these values to the dictionary it iterates through and compares values. If the value is not present, then it adds it and adds the value of the occurrence to '1.' If it is already in the dictionary, then it simply increases the value of occurrence by '1.' Once that is done it outputs the date followed by the amount of times it occurs in the "out.txt" file for each dictionary entry.

```
